Family adding visiting children

Developer implementation guide | 12 October 2026

Purpose
Allow a signed-in Quisat parent with an existing family to bring children visiting their home to a Kids Church Sunday service. Add visitors from the existing Check-in page alongside the family children.

Confirmed scope
The visitor form contains child name, age/date of birth, relationship to the family and optional allergies/additional care needs, plus church/service context. Do not add guardian permission confirmation or authorised collector inputs. Reuse the family collection arrangements already held in the system.

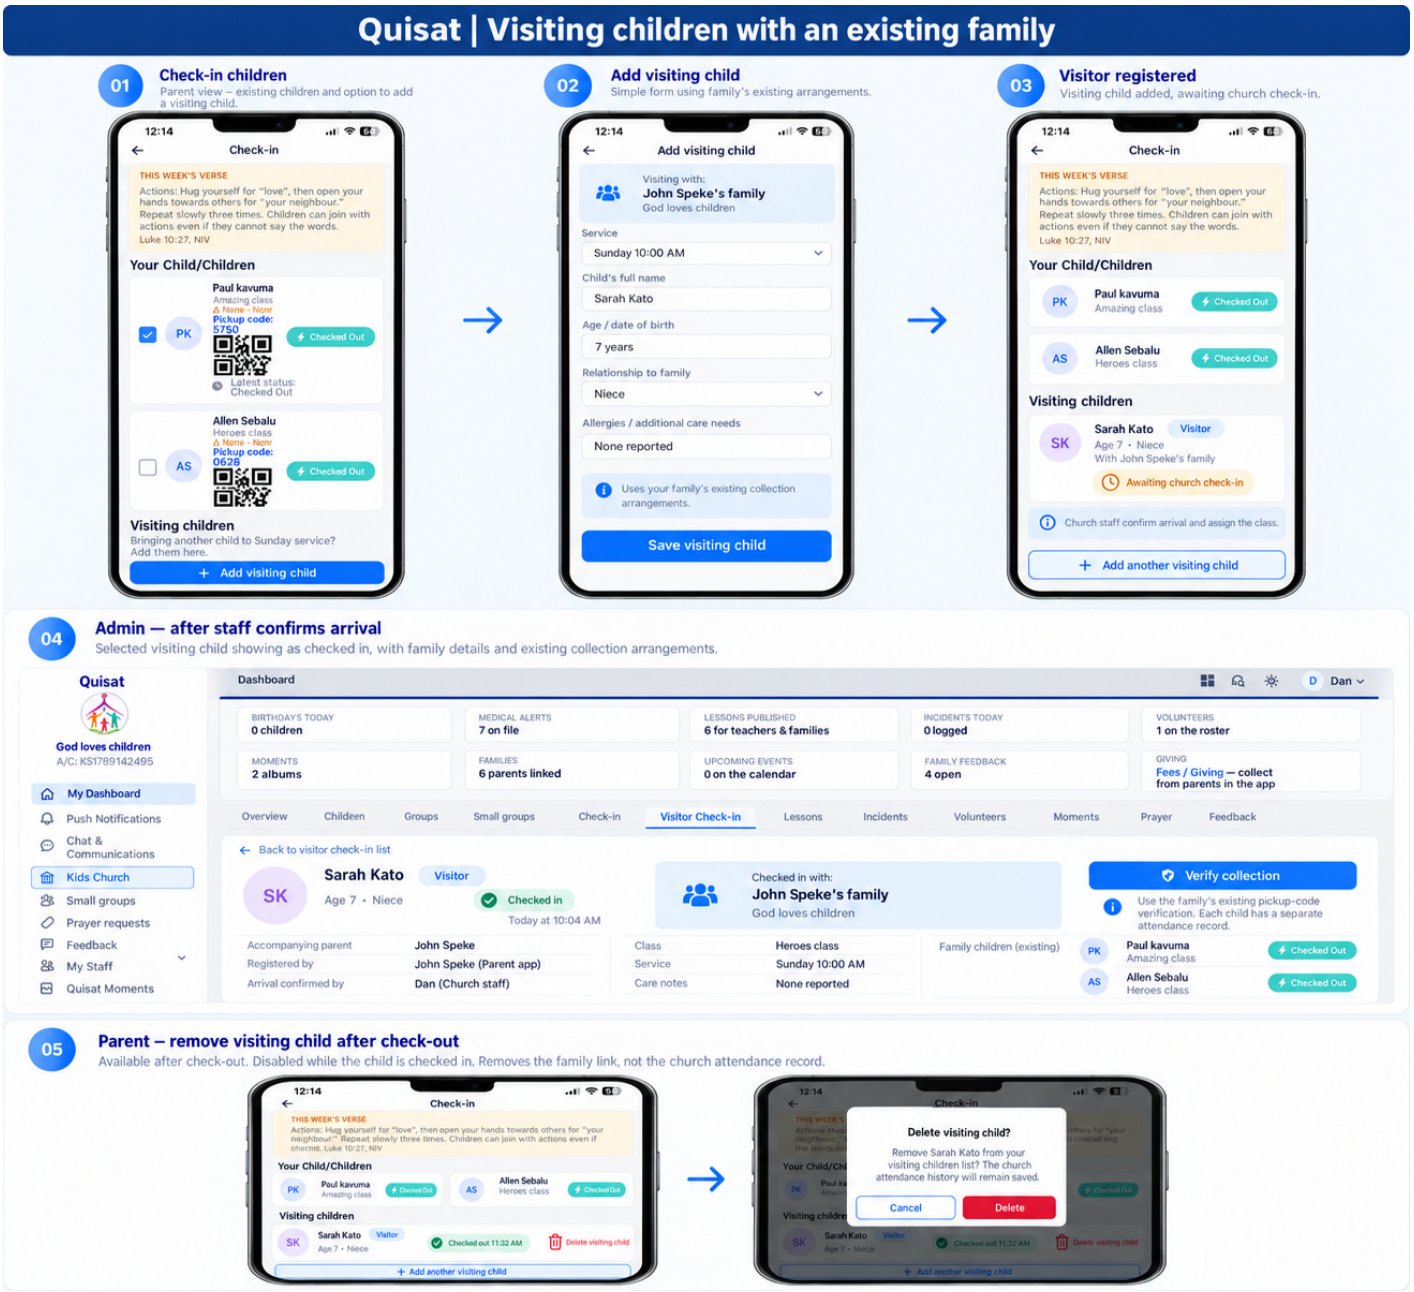

Family association
Link the visiting child to the existing family as a visitor, not as the parent's own child. Show that family prominently in admin details. Do not automatically enrol the visitor as a regular church member.

Attendance sequence
Parent saves registration: Awaiting church check-in. Staff confirms arrival and class: Checked in. Staff verifies collection using the existing process: Checked out. Parent can then remove the visiting child from their list.

Mockup interpretation
All five mockup stages are explained in this guide. Existing children shown as Checked Out are sample screenshot states, not required defaults. Use actual live statuses. Written instructions take precedence over any omitted control in the illustration.

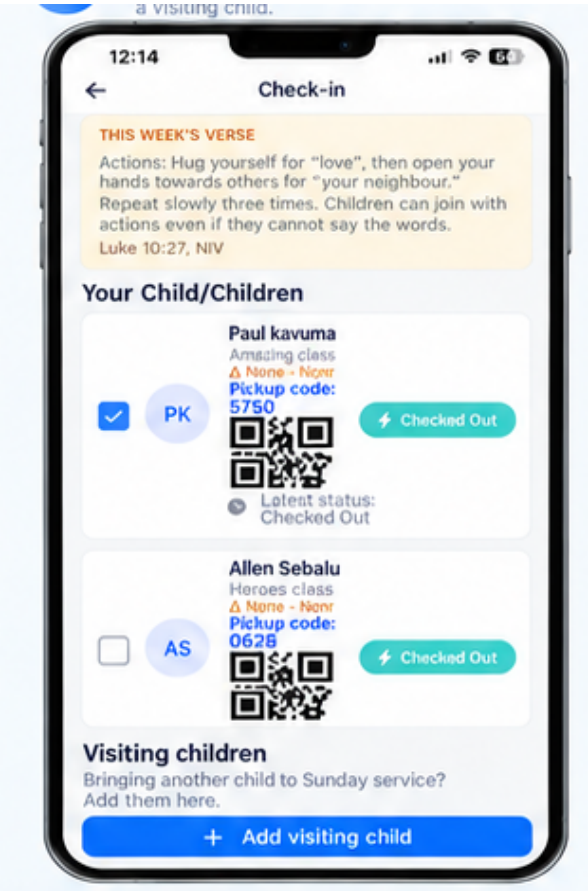

Complete updated mockup

Developer implementation guide | 12 October 2026

01 Parent: Check-in children

Developer implementation guide | 12 October 2026

Placement

Keep the current Check-in header, verse card and registered child cards. Add a Visiting children section immediately below the existing children and a + Add visiting child button.

Action

Open the visitor form within the selected church and family context. Use the signed-in parent's existing family ID; do not ask them to create another account.

Existing children

Preserve their current check-in, pickup-code and QR behaviour. Adding a visitor must not change their membership, attendance or status.

Access

Only authorised family users can add visitors to that family. If more than one family is linked to the account, require explicit family selection.

02 Parent: add visiting child

Developer implementation guide | 12 October 2026

Form fields

Required: full name, age or date of birth, and relationship to family. Optional: allergies/additional care needs. Select the church service from configured options. Display Visiting with: [family name] as context.

Removed fields

No guardian permission checkbox and no authorised collector name input. Reuse the family's existing eligible collectors and pickup settings. Do not introduce a new consent step in this form.

Save behaviour

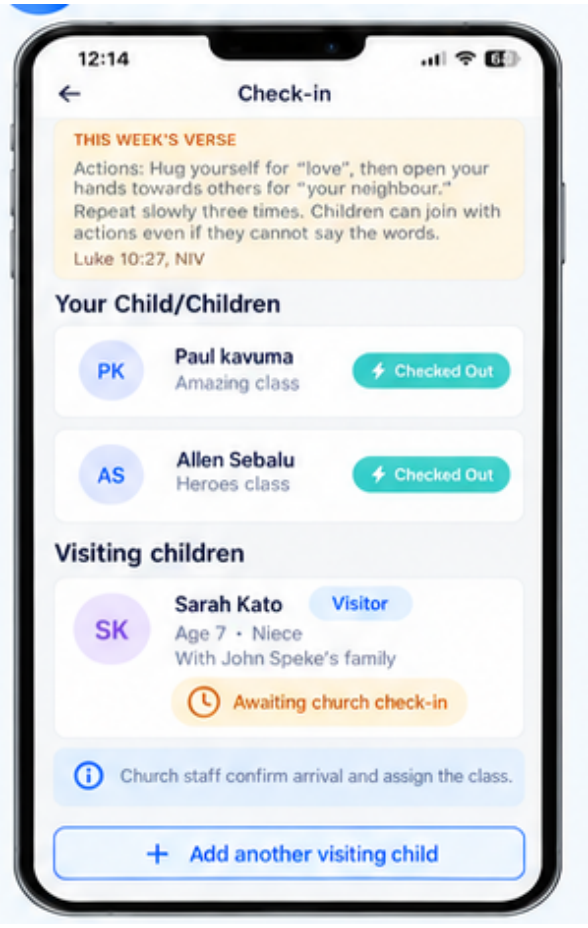

Validate values, preserve the form on error and block duplicate submissions. Save visitor and family link with the selected service. Do not count the child as physically present yet.

Existing records

Avoid duplicate child profiles through a staff-assisted authorised match where needed. Never expose unrelated families through a parent search. Multiple visitors may be added independently.

03 Parent: visitor registered

Developer implementation guide | 12 October 2026

Visitor card
Show name, age, relationship, Visitor badge and With [family name]. Display Awaiting church check-in until staff records arrival.

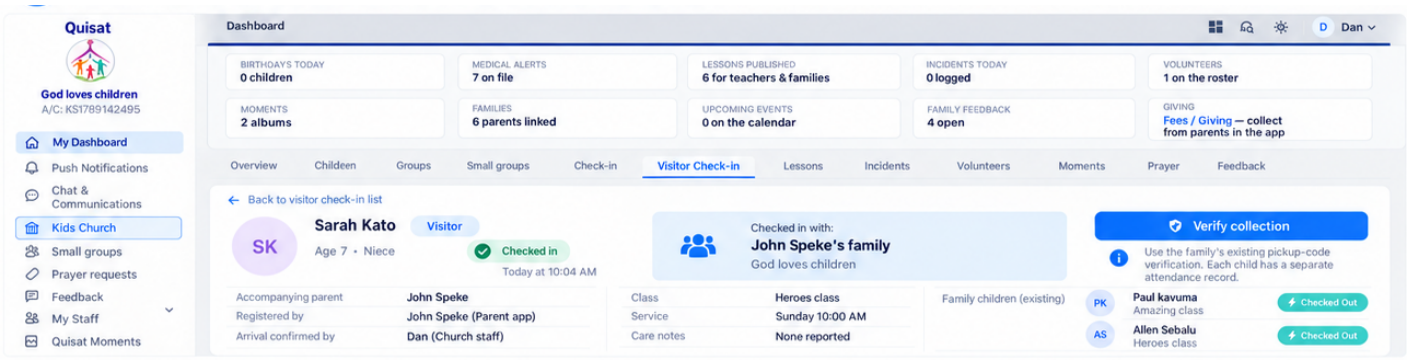

Next action
Allow Add another visiting child. Keep family children and visitors distinct on the same page. Refresh each child's status after staff check-in and collection.

Staff confirmation
Staff locates the registration, confirms the child is present and assigns a configured class. Save server arrival time and staff actor on a separate child attendance record.

Service handling
Registrations are service-specific. Reusing a linked visitor for another service creates a new registration/attendance, not another profile. Do not silently carry old attendance forward.

04 Admin: family and child details

Developer implementation guide | 12 October 2026

Navigation and visibility

Use Visitor Check-in immediately after Check-in. Show pending parent registrations separately from Inside attendance. When staff confirms arrival, the same visitor record appears as checked in; no admin re-registration is required.

Required details

Show visiting child name, age, relationship, class, service, care notes and status. Prominently show Checked in with: [family name], accompanying parent, Registered by [parent] - Parent app, and Arrival confirmed by [staff]. Record checkout time, collector and staff actor after collection.

Shared records

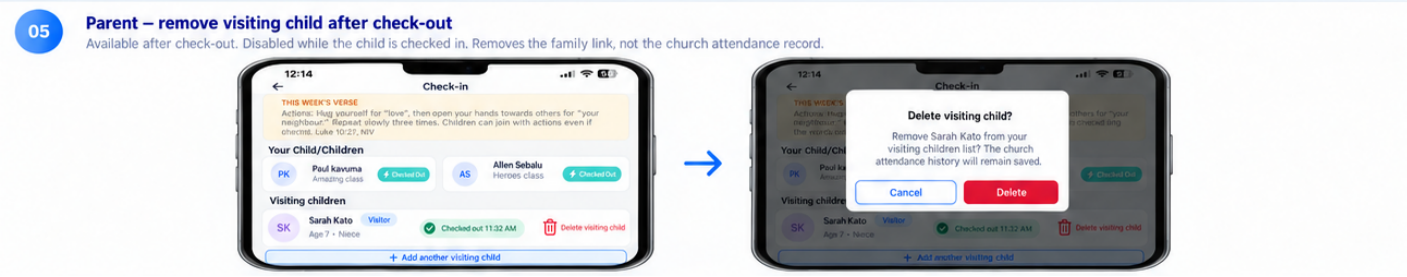

Parent, staff and admin use the same visitor, family link and attendance records. Admin counts must distinguish awaiting arrival, inside and checked out. Each child retains an independent record, including when siblings are collected separately.

Collection

Verify collection uses the current family pickup process and eligible existing collectors. Preserve existing code generation and verification rules. Do not replace the current four-digit/code logic with a new format. A valid code and required collector verification remain necessary.

05 Parent: delete after check-out

Developer implementation guide | 12 October 2026

Delete action

Display Delete visiting child on a visitor card after checkout. Disable or hide deletion while any active attendance for that family link remains checked in. Enforce this on the server, not just the button.

Confirmation

Title: Delete visiting child? Message: Remove [child name] from your visiting children list? The church attendance history will remain saved. Buttons: Cancel and Delete. Cancel changes nothing.

What deletion means

Remove or archive the active visiting-child link from the parent's list. Preserve child visit history, church attendance, registered-by family attribution, collection records and audit events. This is not deletion of the church record or another family's child profile.

Reliability

Record removal actor and time. Re-check attendance state when deletion commits so a simultaneous check-in cannot bypass the restriction. Show success only after saving; failed deletion leaves the card visible with retry.

Pending registrations

The illustrated Delete action covers completed visits. If cancellation before arrival is implemented, make it a separate Cancel registration action and preserve its audit trail. Never mark cancellation as checkout.

Developer requirements & checks

Developer implementation guide | 12 October 2026

Data and permissions

Store visitor child ID, accompanying family ID, registered-by parent ID, church/service ID and relationship. Keep service registration and attendance distinct. Protect all reads and changes by family/church permissions. Limit care notes to responsible church staff.

01 Registration check

An existing parent adds two visitors without creating another family. Form contains no guardian permission or collector field. Visitors appear beside existing children with the Visitor badge and Awaiting church check-in state. Required fields and repeated-save prevention work.

02 Staff and admin check

Staff confirms only one visitor's arrival. Only that visitor counts as inside. Admin details show the correct accompanying family, registering parent and confirming staff. The other visitor remains awaiting arrival.

03 Collection check

Use existing pickup verification and collectors. Collect one child while another remains inside. Parent, staff and admin reflect each status correctly. Invalid code or failed collector verification blocks release.

04 Deletion check

A checked-in visitor cannot be removed, including through direct API calls. After checkout, Cancel preserves the card; Delete removes the family link from the parent list. Admin historical attendance still shows the child, family, collector and staff records.

05 Reliability check

Retries do not duplicate registrations or attendance. Failed save/delete does not show false success. Another parent or church cannot retrieve or change these records. Existing family-child and staff check-in behaviour remains intact.

Handover

Deliver parent screens, staff confirmation integration, admin family attribution, delete confirmation and server enforcement. Confirm compatibility with existing family pickup logic before implementing. This guide describes the existing-family visitor flow only; retain the separate walk-in visitor workflow.
