Login advert improvements

Developer instructions and current / proposed visual comparisons

Goal and scope

Improve the sponsored advert shown after successful login, before the dashboard opens. Replace oversized empty gaps with a cohesive advertiser theme, a prominent advert and a clear countdown. Keep the existing authentication and dashboard access logic.

Required screen layout

1. Compact header: advertiser logo/name and a Sponsored label. Avoid a second oversized standalone logo.

2. Main advert: use the available content area, rounded corners and proportional image scaling. Never stretch the artwork or crop important text.

3. Optional message: one brief advertiser-approved headline or benefit. Hide the block when no copy is supplied.

4. Action button: show only when a valid destination exists; for example Explore stationery or Explore Craneflyer.

5. Powered-by footer: show "Quisat app is powered by [Advertiser Name]" above the countdown text and progress bar. Keep the whole footer above device navigation.

Responsive design and advertiser themes

Use safe-area insets and responsive spacing rather than fixed vertical gaps. Suggested starting values: 16-24 dp side padding, 12-20 dp between sections, and buttons at least 48 dp high. Test small screens and larger text sizes; keep the countdown visible and allow the content area to scroll when needed.

Support advertiser background, accent and text colours, with an optional subtle pattern. Picfare and Uganda Airlines are examples only. Campaign imagery and copy must remain configurable; do not hard-code these brands.

Picfare: current and improved

CURRENT

AFTER IMPROVEMENT

Cream and gold theme and expanded campaign. Footer: Quisat app is powered by Uganda Airlines.

Mockup is a design reference. Use original approved campaign assets in implementation; do not use the whole phone-frame image as app artwork.

Behaviour and acceptance checks

Implementation details for the developer

Countdown and navigation

Preserve the configured advert duration. The examples show different remaining times (6s and 3s); these are illustrative countdown states, not separate brand rules.

Start the countdown only when the advert is visible and ready. Update the text and progress bar from the same timer. At zero, navigate to the dashboard once.

When the action button is tapped, cancel automatic dashboard navigation before opening the destination. On return, show a Continue to dashboard control so the user is not trapped or redirected unexpectedly.

Pause countdown while the app is in the background. If no active advert is available, the image fails, or loading exceeds a bounded timeout, continue to the dashboard. An advert failure must not block access.

Admin campaign configuration

Provide fields for advertiser name, logo, campaign image, optional headline/message, button label and destination, background/accent/text colours, display duration, active status and campaign start/end dates. Preview the screen before activating a campaign. Validate supported destinations.

Image handling

Offer portrait and landscape creative layouts. For existing landscape banners, preserve the full banner and use approved supporting copy or themed background to balance the page. The Uganda Airlines concept rearranges its artwork; a faithful portrait version requires suitable original image and text assets, not a stretched banner.

Acceptance checklist

• Both themes show the correct powered-by name, with no oversized gaps, overlapping controls or hidden countdown.

• Images retain correct proportions and important campaign text stays visible.

• Countdown completes once; tapping the advert prevents a competing automatic redirect.

• Small Android and iOS screens, safe areas and enlarged text remain usable.

• No-ad, failed-image, slow-loading and background/return flows still allow dashboard access.

Powered-by message requirements

Required in every active post-login advertiser screen

Exact wording and placement

Quisat app is powered by [Advertiser Name]

Place this line below the advert action button and above the countdown, inside the footer panel. Use readable contrasting text. The advertiser name must match the campaign currently on screen.

Examples shown in the revised mockups

Picfare: Quisat app is powered by Picfare
Uganda Airlines: Quisat app is powered by Uganda Airlines

Developer implementation

Build the message dynamically from the active campaign advertiser display name: "Quisat app is powered by " + advertiser_display_name. Use the same campaign record for the header, artwork, button and powered-by line.

Keep the fixed prefix in app text, rather than embedding the entire line in the advert image. This allows correct name updates and responsive text layout.

Use centered text, suggested 14-16 sp, medium or semibold weight. Allow natural wrapping onto two or more lines for long names and accessibility text sizes. Do not truncate the advertiser name or cover the countdown.

Reserve footer height for the complete message, countdown and progress bar. Reduce flexible image space first; on smaller screens keep the footer visible and let the content above scroll if necessary.

Require a non-empty advertiser display name before a campaign can be activated. If campaign data is invalid or no advert is shown, proceed to the dashboard without a placeholder powered-by line.

Acceptance checks

Switching between campaigns changes the advertiser name everywhere. Verify both example messages exactly, then test a long name and enlarged text. The line, countdown and bar must remain readable above the system navigation area.

Picfare and Uganda Airlines are illustrative campaign examples. Apply the same message format to whichever advertiser is displayed.
