Quisat | Improvements to existing features

Primary instruction to the developer

Keep all existing processes, workflows, dashboard layouts and working functionality as they are. Implement only the improvements described in this document. Extend existing screens and controls wherever possible.

Existing registration, parent-child linking, code generation, validation, permissions, service selection and check-in/check-out logic must continue to work. The code filter changes the displayed list only; it must not change attendance or bypass existing checks.

Included improvements

1. Add Parent from the child information form.
2. Filter children using the existing parent 4-digit code control.
3. Filter information and choose columns before downloading.
4. Add School Attended to each child form.
5. Allow the assigned group leader to record attendance and add visitors.

How to use the mockups

Mockups illustrate placement and behaviour. Sample names, dates and counts are examples. Written instructions take priority over illustrative details. Preserve existing fields, labels and actions unless a change is specifically requested.

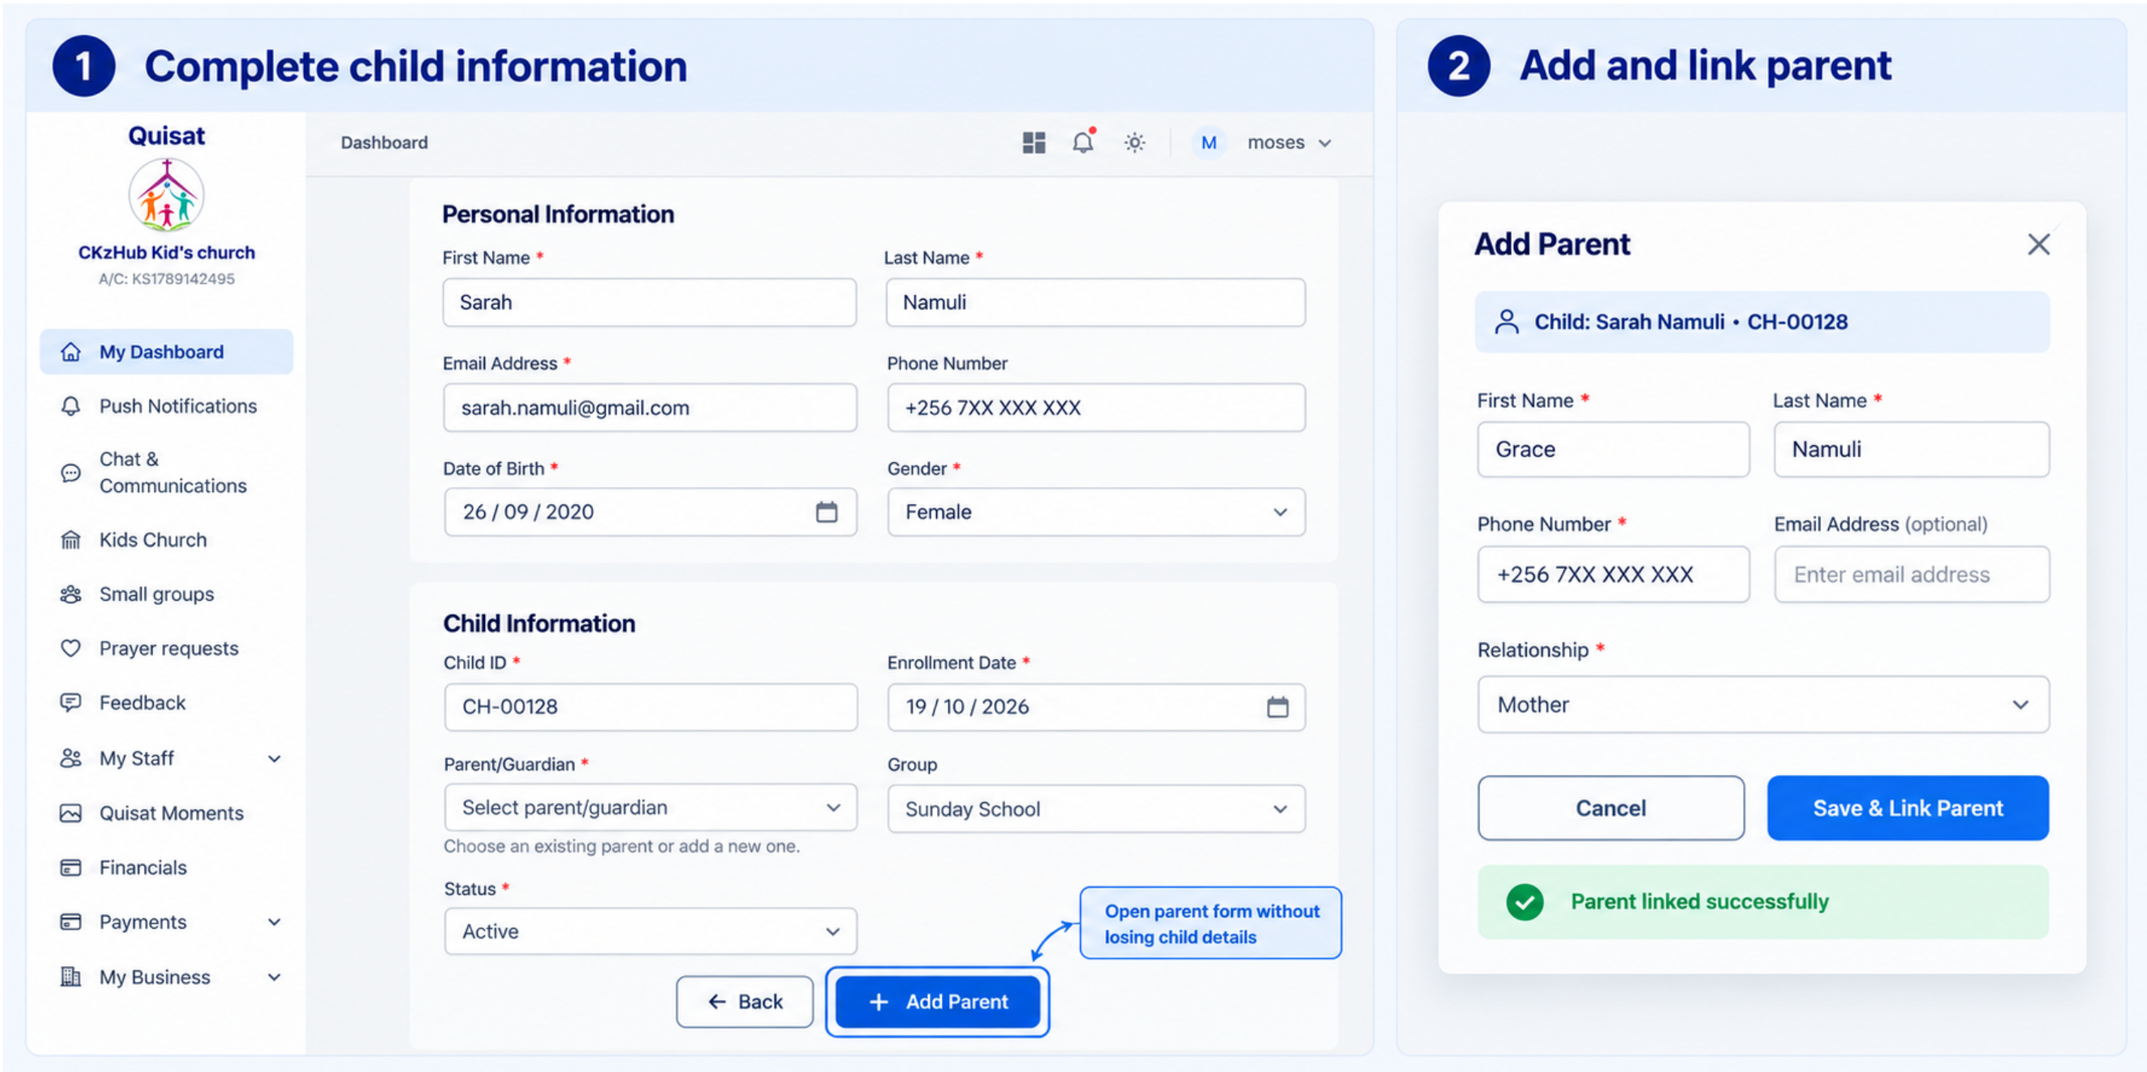

Completion check: Verify each improvement and confirm the existing end-to-end processes still work, including saving, returning to a form, validation and authorised access.

1 | Add Parent from child information

Place **Add Parent** at the end of the child information form. Open the parent form while preserving the child details already entered; keep the existing option to select an existing parent.

On successful parent save, link the parent to the child and show confirmation. Cancel or Back must retain the child information. Continue using existing validation and duplicate-parent checks.

Important: Parent/Guardian being empty must not block opening Add Parent. Complete the required parent link before final child registration. Keep other registration steps unchanged.

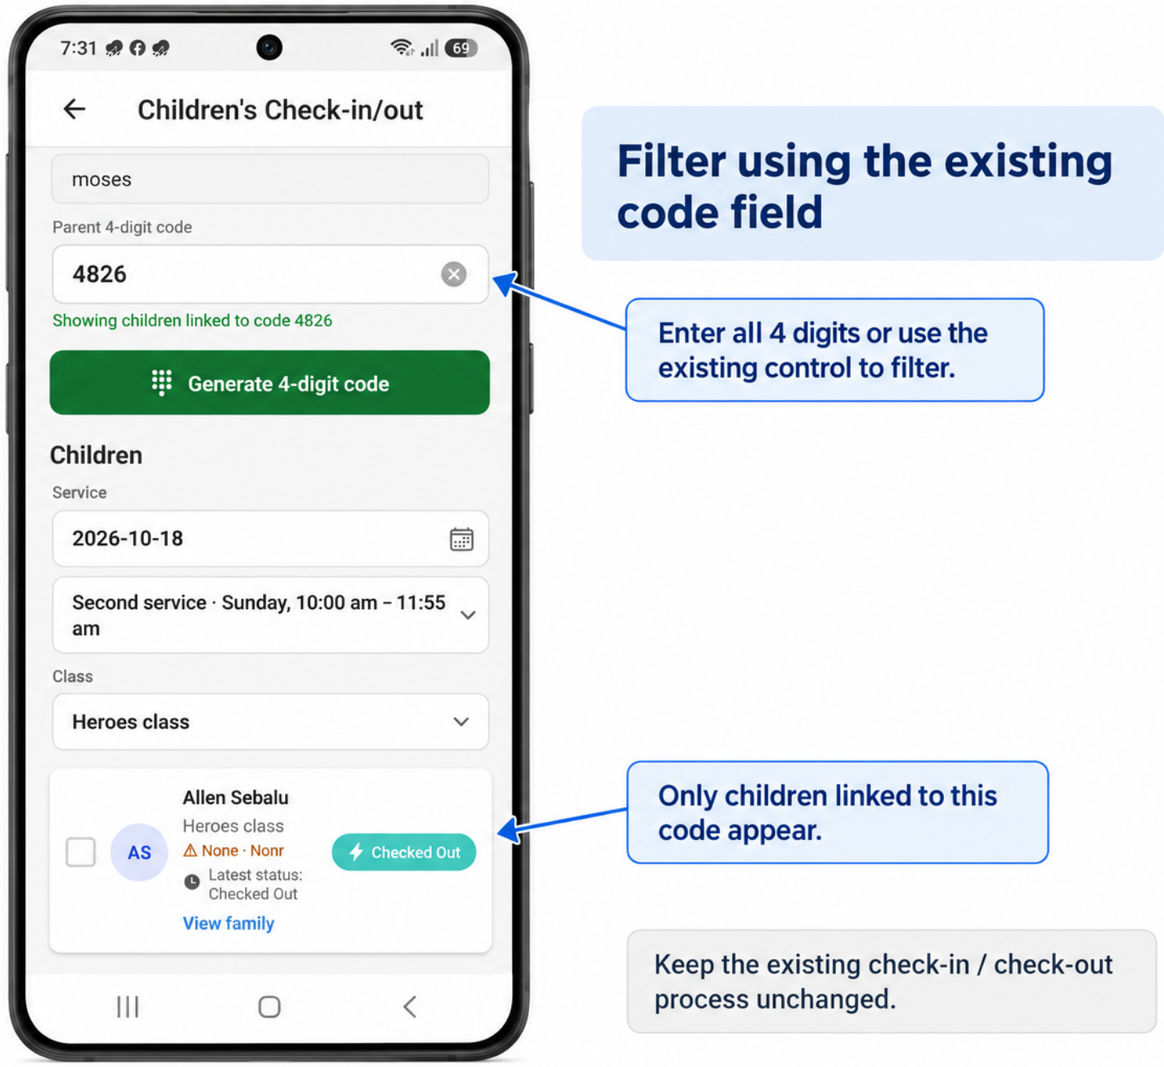

2 | Filter children by the existing parent code

Make the existing **Enter parent's 4-digit code** control filter the children's list when all four digits are entered or its existing action is clicked. **Do not add a separate Search button.**

Display only the child or children linked to that exact code. Do not present the full parent check-in list as the code search result. Show a clear message when no match is found.

Keep unchanged: code generation, existing code validation and all remaining check-in/check-out steps. Filtering must not automatically check a child in or out. The green Generate 4-digit code action keeps its existing purpose.

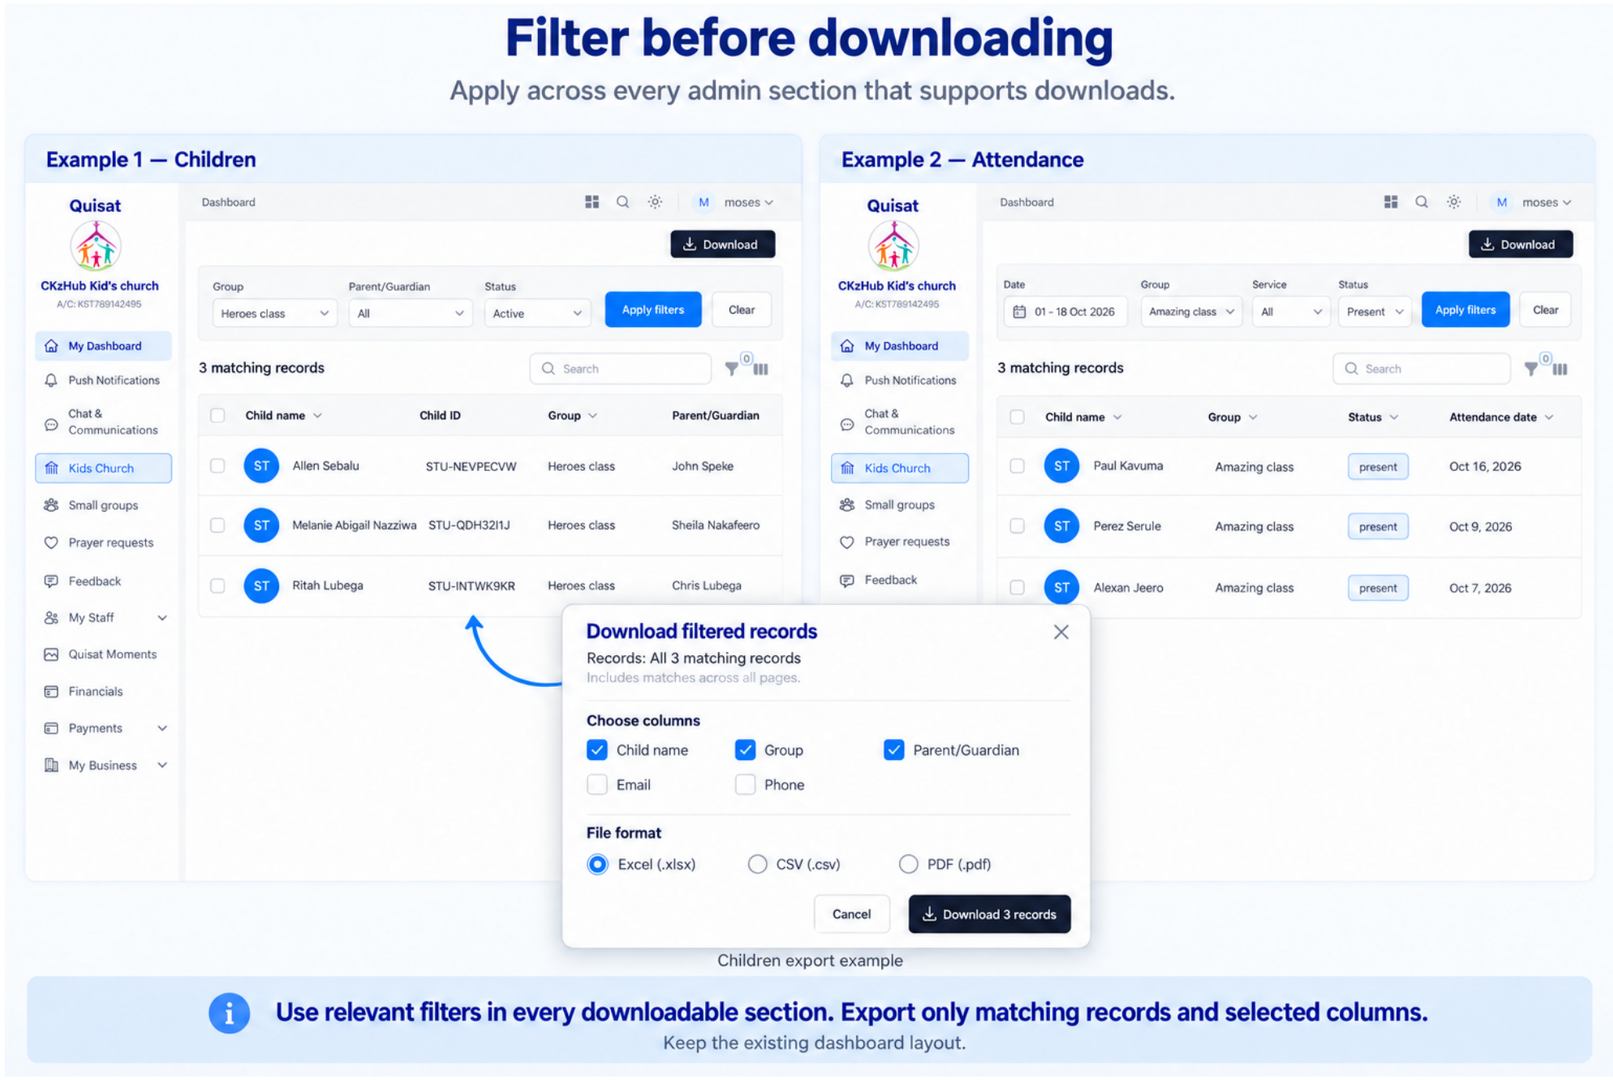

3 | Filter before downloading across the dashboard

Apply this improvement to **every admin section that supports downloading**. Children and Attendance are examples. Provide filters appropriate to each section, such as dates, class/group, service, status or parent/child.

Apply filters, show the matching record count, allow selection of export columns, then download in Excel, CSV or PDF. Export only the matching records and chosen columns, including matches across all pages.

Keep the existing layout and other actions. Ensure download controls respond correctly. When no records match, show **No records found. Please adjust your filters.** and prevent an empty download.

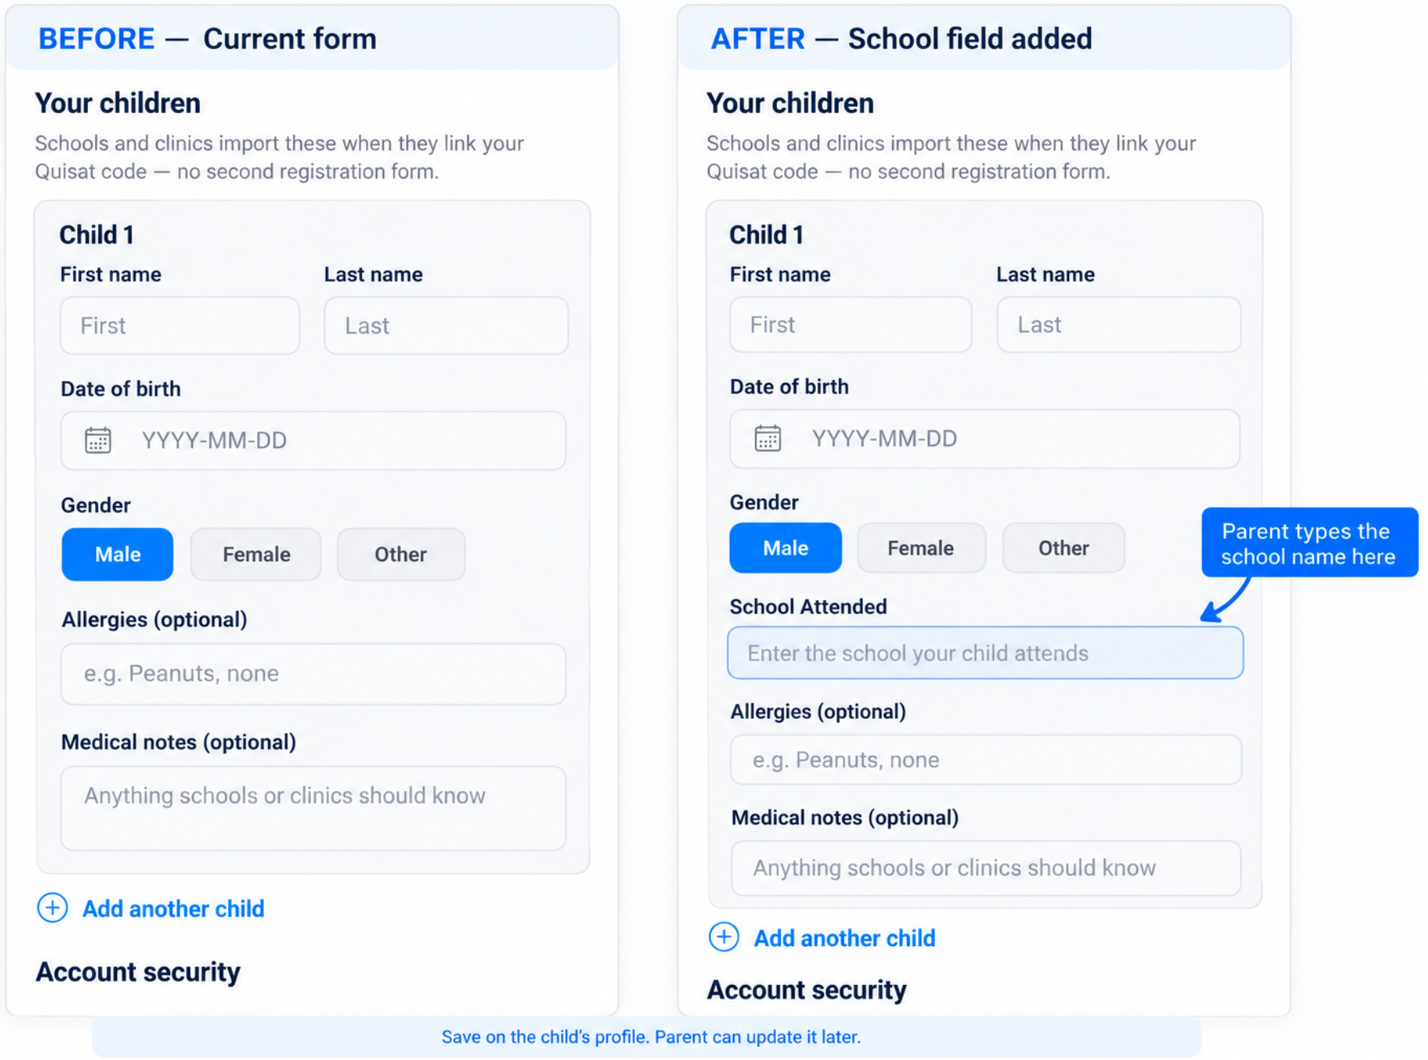

Children export example

4 | School Attended in the child form

Add a **School Attended** text field below Gender in each child's information card. Placeholder: **Enter the school your child attends.** The parent types the school name; this is not a dropdown.

Save the value on that child's profile and let the parent update it later. Include the same field when using Add another child. Preserve all other child fields and registration steps.

Keep the field optional so children who do not yet attend school can still be registered. Recording the school name must not automatically enrol the child in, or link the family to, that school.

5 | Assigned group leader: attendance and visitors

Enable **the leader assigned to that specific group** to select a meeting date, mark registered members Present or Absent, and save, review or correct that group's attendance. Enforce access to assigned groups only.

Provide **Add Visitor** within the meeting: capture visitor name, parent/guardian where applicable and optional contact. Label visitors clearly and record them separately without automatically enrolling them as members.

Show members present, visitors present, total attended and absent members. Admin can review by group and meeting date. Prevent duplicate attendance entries for the same member and meeting; preserve existing group setup and membership processes.
