

Class dropdown filter

Children's Check-in/out | Preserve the existing four-digit code process

Placement and filtering

- Add a **Select class** dropdown above the children's list, using the existing app styling.
- List only classes assigned to the logged-in teacher. Selecting a class shows only children in that class.
- Automatically select the class when the teacher has one assigned class. For multiple classes, show **Select class** until a choice is made.

States and selection

- Empty class: **No children in this class.** No assigned classes: **No classes assigned. Please contact your administrator.**
- Changing classes clears previous child selections so hidden children cannot be included in an action.

Preserve and verify

- Keep code generation, parent-code entry, validation, pickup code reuse, child cards, status indicators and check-in/out actions unchanged.
- Verify one-class auto-selection, multiple-class filtering, empty states, cleared selections and the existing code flow.

- One assigned class: automatically selected.
- Switch class: update children and clear previous selections.

One child or one family

Proposed family view | Retain existing child and family code rules

Class view

- Select one child from the filtered class list and use the existing check-in/out code process.
- Add a **View family** option to the child card to open siblings linked through the existing family relationship.

Family view

- Show the family's children together, with each child's class and attendance status, including siblings in different classes.
- Allow individual sibling selection and **Select all siblings**. Show the number of selected children and the family.
- Provide **Back to class view**. Clear selections when moving between class and family views to avoid unintended actions.

Permissions and validation

- Family view must respect existing permissions. Do not grant access to siblings outside the teacher's authorised scope.
- Use existing family identifiers and code rules; do not infer a family from matching names. Verify one-child and family actions and cross-class siblings.

Use the existing code process for this family.

3 children selected · 1 family

- Class view: select one child. Family view: select siblings together.
- Existing code validation and check-in/out rules remain unchanged.

Staff Check-in/out

Home shortcut and staff attendance screen | Separate staff attendance records

Placement and staff screen

- Add **Staff Check-in/out** under **Your favourites** on the staff home screen.
- Show the logged-in staff member's name, organisation, branch and today's status: **Not checked in**, **Checked in** or **Checked out**.
- Before arrival, show **Check in**. After saving arrival, show its time and **Check out**. After departure, show arrival, departure and total time recorded.
- Include **My attendance history** for previous records.

Permission rule - includes the user's edit

- Staff normally record only their own attendance. An authorised administrator may grant permission to record attendance for other staff within the permitted organisation and branch.
- For attendance recorded on another person's behalf, store both the staff member and the person recording it; enforce the permission on the server.

Keep children's flow unchanged

- Staff attendance has its own screen and records. Do not change the children's check-in/out code logic.

Staff recording and admin rules

Developer requirements take precedence over illustrative mockup details

Reliable recording

- Store staff ID, organisation, branch and server-recorded timestamps. Display times in the organisation's timezone.
- Prevent duplicate submissions and check-out without an active check-in. Support check-out after midnight for an active session.
- Show success only after saving. On failure, show an error and allow retry without creating duplicate records.

Administrator access

- Authorised administrators can view attendance, filter by date, staff member and branch, and export records.
- Administrator corrections retain original values, who made the change and the reason.

Acceptance checks

- Verify check-in, check-out, completed totals, attendance history, duplicate prevention, failed-save handling and overnight attendance.
- Verify self-only access, explicitly granted permissions for recording on behalf of others, and organisation/branch boundaries.

Mockup scope

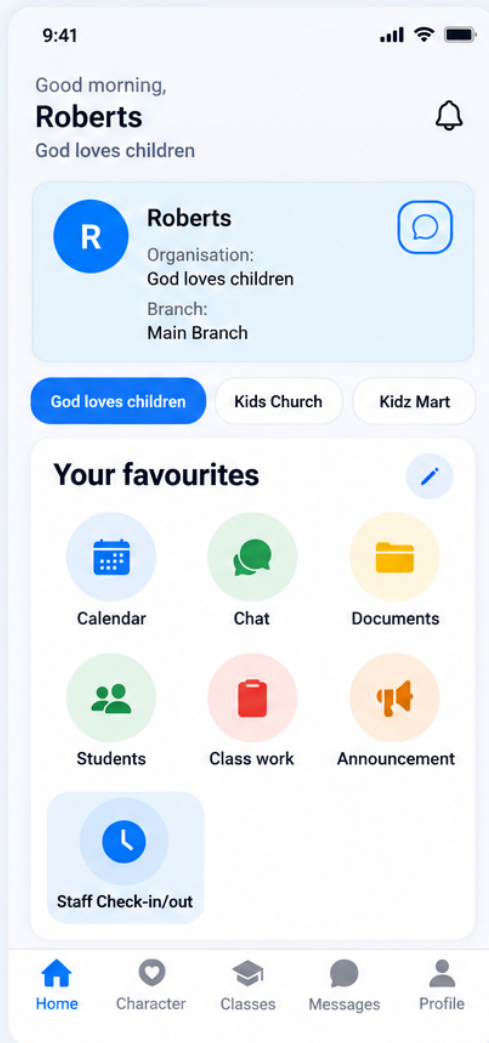

- The staff mockup shows the home shortcut, before check-in and checked-in states. The completed state must display arrival, departure and total time as specified above.
